YENEPOYA INSTITUTE OF ARTS, SCIENCE, COMMERCE AND MANAGEMENT

A CONSTITUENT UNIT OF YENEPOYA (DEEMED TO BE UNIVERSITY)

BALMATTA, MANGALORE

A FINAL PROJECT REPORT ON

"Natural Language Interface for E-Commerce"

SUBMITTED BY

Mohammed Kunhi Upp

III Year BCA

(Artificial Intelligence, Cloud Computing and DevOps)With IBM&TCS

REGISTER NUMBER: 23BCAICD061

UNDER THE GUIDANCE OF

Ms.Deepthi K

[Faculty Guide]

INDUSTRY IBM MENTOR: Sumit Kumar Shukla

DEPARTMENT OF COMPUTER SCIENCE

IN PARTIAL FULFILMENT OF THE REQUIREMENT FOR THE AWARD OF THE DEGREE OF

BACHELOR OF COMPUTER APPLICATIONS

MAY 2026

CERTIFICATE

This is to certify that the project report entitled **"Natural Language Interface for E-commerce Infrastructure"** submitted by **Mohammed Kunhi UPP**, III Year BCA (AI, Cloud Computing & DevOps) with IBM & TCS, VI Semester, to the Department of Computer Science, Yenepoya Institute of Arts, Science, Commerce and Management, Yenepoya Deemed to Be University, Mangalore, is a record of bonafide project work carried out by the student under my guidance and supervision.

The report has not been submitted previously for the award of any Degree or Diploma to any University.

Internal Guide	IBM Mentor	Head of Department

DECLARATION

I, **Mohammed Kunhi UPP**, student of III Year BCA (AI, Cloud Computing & DevOps) with IBM & TCS, VI Semester, Department of Computer Science, Yenepoya Institute of Arts, Science, Commerce and Management, Yenepoya Deemed to Be University, Mangalore, hereby declare that the project report entitled **"Natural Language Interface for E-commerce Infrastructure"** submitted in partial fulfilment of the requirement for the award of the Degree of Bachelor in Computer Application is my original work and has not been submitted to any other University or Institution for the award of any Degree or Diploma.

I also declare that all the sources of information used in this project have been duly acknowledged.

Place: Mangalore

Date: May 2026

Mohammed Kunhi UPP

III Year BCA (AI, Cloud Computing & DevOps) with IBM & TCS

VI Semester

ACKNOWLEDGEMENT

I express my sincere gratitude to the Principal of Yenepoya Institute of Arts, Science, Commerce and Management for providing all the necessary facilities and an encouraging academic environment to carry out this project successfully.

I am deeply thankful to the Vice Principal for the constant support and motivation extended throughout the course of this academic year.

I extend my heartfelt thanks to the Head of the Department of Computer Science for the invaluable guidance, encouragement, and for creating an atmosphere that fosters innovation and practical learning.

I am sincerely grateful to my Internal Guide whose expert supervision, constructive feedback, and technical insights were instrumental in shaping this project from conception to completion.

I would also like to thank the industry mentors from IBM and TCS whose real-world perspectives and professional guidance enriched the depth and practical relevance of this project.

My sincere appreciation goes to all the faculty members of the Department of Computer Science for their continuous support and encouragement throughout my academic journey.

Finally, I am deeply grateful to my family and friends for their unwavering moral support, patience, and encouragement without which this endeavour would not have been possible.

Mohammed Kunhi UPP

ReAct	Reasoning + Acting (LangChain Agent Pattern)

EXECUTIVE SUMMARY

Background	This project presents a Natural Language Interface (NLI) for E-commerce Infrastructure, enabling users to query and control e-commerce systems through plain English commands rather than complex dashboards or SQL queries.
Aim	To build a ChatOps-style conversational system that democratises data access for both technical and non-technical stakeholders in an e-commerce environment using Python, basic string matching, and an extended LLM-powered backend.
Technologies	Python 3.10+ • LangChain • Ollama (Llama 3.2) • Flask • SQLite • HTML5/CSS3 • VS Code
Hardware Architecture	Single local machine (laptop/desktop) with minimum 8 GB RAM, 20 GB disk, and any modern CPU. Ollama-based local inference eliminates cloud hardware dependency for the prototype phase.
Software Architecture	Three-tier: Presentation (HTML ChatOps UI + Flipkart Admin Dashboard), Application (Flask REST API + LangChain ReAct Agent), and Data (SQLite product database). The core CLI tier requires only Python stdlib.

1. BACKGROUND

1.1 Industry Context

The modern e-commerce landscape is driven by data. Businesses operating on platforms like Flipkart, Amazon, or Meesho must monitor hundreds of operational metrics simultaneously — server uptime, inventory levels, order volumes, pricing, and active user counts — all through complex dashboards that require significant technical expertise to navigate.

Non-technical stakeholders such as store managers, marketing executives, and customer support staff are often excluded from real-time data access simply because the tools are too complicated. This creates bottlenecks, delays decisions, and reduces operational agility.

1.2 Problem Statement

Existing e-commerce management interfaces require users to understand SQL queries, navigate multi-panel dashboards, or write API calls. This technical barrier prevents non-technical team members from independently accessing the operational data they need to make timely decisions.

1.3 Motivation

The rapid advancement of Large Language Models (LLMs) has created an opportunity to build interfaces that understand natural human language. Combined with established frameworks like LangChain, it is now feasible to build a system where a store manager can simply type *'What is the current stock for iPhone 15?'* and receive an accurate, real-time answer — without writing a single line of SQL or understanding database schemas.

1.4 Project Origin

This project was conceived as part of the BCA (AI, Cloud Computing & DevOps) curriculum at Yenepoya Institute of Arts, Science, Commerce and Management, in collaboration with IBM and TCS. The project brief specified building a ChatOps-style natural language interface for e-commerce systems using Python, string matching, and modern AI/DevOps tools.

1.5 Scope

The project is implemented in two tiers:

- **Core CLI Tier:** A Python command-line chatbot using basic string matching and if/elif logic. This is the primary academic deliverable.
- **Extended Web Tier:** A Flask REST API + LangChain ReAct agent + Ollama (Llama 3.2) + SQLite + HTML frontend demonstrating real-world application.

2. AIM AND OBJECTIVES

2.1 Aim

To develop a Natural Language Interface for E-commerce Infrastructure that enables users to query inventory data, check system status, and navigate administrative dashboards using plain English commands — eliminating the need for technical expertise.

2.2 Objectives

- **1.** Design and implement a Python CLI chatbot using basic string matching and if/elif logic to handle common e-commerce queries.
- **2.** Build a keyword-to-intent mapping system (KEYWORD_MAP) and a predefined response library (RESPONSE_MAP) covering six core commands: help, status, price, stock, orders, and exit.
- **3.** Extend the CLI with a Flask REST API backend that exposes a /chat endpoint for browser-based interaction.
- **4.** Integrate a LangChain ReAct agent powered by Ollama (Llama 3.2) for dynamic, semantic intent understanding beyond keyword matching.
- **5.** Create a SQLite product database (ecommerce.db) with real product data and connect it to the agent for live SQL-based query responses.
- **6.** Build a responsive Flipkart-themed ChatOps web UI (index.html) and an Admin KPI Dashboard (flipkart.html).
- **7.** Document the system through a formal HLD and LLD suitable for academic and professional review.
- **8.** Demonstrate the upgrade path from a simple CLI chatbot to a production-ready cloud-deployable system.

2.3 Expected Outcomes

- A working CLI chatbot that responds accurately to e-commerce queries using Python string matching.
- A functional web-based ChatOps system that uses LLM reasoning to answer natural language questions and query a live database.
- Comprehensive design documentation (HLD + LLD) and this final project report.
- A clear, reproducible setup guide for beginner developers to run both project tiers.

3. TECHNOLOGIES USED

3.1 Core Technologies

Technology	Version	Role in Project
Python	3.10+	Primary programming language for both CLI and web tiers
Flask	2.3.3	Lightweight REST API framework for the /chat endpoint
Flask-CORS	4.0.0	Cross-origin request handling for browser frontend
LangChain	0.2.16	Agent framework; provides ReAct agent, prompt templates, tool binding
langchain-ollama	0.1.3	Connector between LangChain and the local Ollama LLM runtime
langchain-community	0.2.16	Provides SQLDatabase utility for SQLite integration
Ollama	Latest	Local LLM runtime; serves Llama 3.2 over HTTP on port 11434
Llama 3.2	3.2B params	Open-source LLM for natural language understanding and generation
SQLite3	Built-in	File-based relational database storing product catalogue
SQLAlchemy	2.0.32	ORM/engine layer; auto-installed with LangChain community
HTML5 / CSS3	—	Frontend markup and styling for ChatOps UI and Admin Dashboard
JavaScript (ES6)	—	Async Fetch API, DOM manipulation, redirect logic in browser
VS Code	Latest	IDE for development, debugging, and terminal execution

3.2 Why These Technologies?

Python — Python is the de-facto language for AI and data applications. Its readable syntax, vast library ecosystem (LangChain, Flask, SQLite3), and native support in VS Code make it ideal for both beginner CLI development and advanced agent-based systems.

LangChain + ReAct Pattern — LangChain's ReAct (Reasoning + Acting) agent pattern allows the LLM to explicitly think about which tool to use before executing it. This makes the system transparent and debuggable — every thought step is printed to the terminal with verbose=True, making it educational as well as functional.

Ollama (Local LLM) — Ollama runs Llama 3.2 entirely on the developer's machine. This means no API keys are required, no internet dependency exists, no cost per token is incurred, and private product data never leaves the local environment. This is ideal for a student project and demonstrates responsible AI deployment principles.

SQLite — SQLite is a zero-configuration, file-based database built into the Python standard library. It requires no server setup, making it perfect for prototype development. The upgrade path to PostgreSQL (for production) is straightforward.

4. HARDWARE ARCHITECTURE

4.1 Development Environment Specifications

Component	Minimum Requirement	Recommended
Processor	Intel Core i5 / AMD Ryzen 5	Intel Core i7 / AMD Ryzen 7
RAM	8 GB	16 GB (for Llama 3.2 + Flask)
Storage	20 GB free space	50 GB SSD
Operating System	Windows 10 / macOS / Ubuntu 20.04	Windows 11 / Ubuntu 22.04
Internet	Required for setup only	Broadband (package downloads)
Display	1366 × 768	1920 × 1080

4.2 Resource Consumption by Component

Component	CPU Usage	RAM Usage	Disk Usage
chatbot.py (CLI)	< 1%	< 50 MB	< 1 MB
Flask API	1–5%	~150 MB	< 5 MB
Ollama (Llama 3.2)	20–80% during inference	~2.0 GB	~2.0 GB
SQLite DB	< 1%	< 10 MB	< 1 MB
Browser (UI)	1–3%	~100 MB	Negligible

4.3 Network Architecture (Local Development)

All communication occurs on localhost. No external network calls are made during normal operation:

- Browser → Flask API: HTTP on 127.0.0.1:5000
- Flask → Ollama LLM: HTTP on 127.0.0.1:11434 (internal)
- LangChain → SQLite: Direct file access (no network)

4.4 Cloud Deployment Architecture (Planned)

For production scale deployment, the following cloud architecture is planned:

- **Frontend:** AWS S3 + CloudFront (static hosting) or Azure Static Web Apps
- **API Server:** Docker container on AWS EC2 or Azure App Service behind a Load Balancer
- **LLM:** AWS Bedrock (Claude) or Azure OpenAI replacing Ollama for auto-scaling inference
- **Database:** PostgreSQL on AWS RDS or Azure Database for PostgreSQL
- **Cache:** Redis on AWS ElastiCache for session and query result caching

5. SOFTWARE ARCHITECTURE

5.1 Overall Architecture Pattern

The extended system follows a three-tier architecture pattern:

Tier	Components	Responsibility
Presentation Tier	index.html, flipkart.html	User input, chat bubbles, KPI dashboard, redirect logic
Application Tier	app.py (Flask), brain.py (LangChain Agent)	Request routing, NLP reasoning, tool selection, SQL dispatch
Data Tier	ecommerce.db (SQLite)	Product catalogue persistence: name, price, stock

5.2 Core CLI Architecture

The CLI chatbot is a single-script, stateless, input-process-output (IPO) system with no external dependencies:

```
Input → preprocess() → match_intent() → get_response() → Output
```

5.3 Extended Web Communication Flow

Step	From	To	Protocol / Data
1	Browser	Flask /chat	HTTP POST JSON { message }
2	Flask	LangChain Agent	Python dict { input: message }
3	Agent	Ollama / Llama 3.2	Prompt string via HTTP:11434
4	Agent	SQLite DB	SQL SELECT via SQLAlchemy
5	SQLite	Agent	Formatted result rows string
6	Agent	Flask	dict { output: final_answer }
7	Flask	Browser	HTTP 200 JSON { reply }

5.4 LangChain ReAct Agent Design

The agent uses the ReAct (Reasoning + Acting) pattern. For each user query, the LLM:

- Reads the user question and the descriptions of available tools.
- Generates a *Thought* explaining which tool to use and why.
- Specifies an *Action* (tool name) and *Action Input* (entity string).
- Receives an *Observation* (tool return value).
- Repeats steps 2–4 if more information is needed.
- Outputs a *Final Answer* when sufficient information is available.

5.5 Tool Architecture

Tool Name	Trigger Condition	Execution	Return
query_inventory	User asks about product/price/stock	SQL LIKE query on ecommerce.db	Matching product rows as string
open_dashboard	User mentions Flipkart/dashboard	Returns sentinel string	'SUCCESS_OPEN_FLIPKART'

6. SYSTEM REQUIREMENTS

6.1 Functional Requirements

FR ID	Requirement	Priority	Tier
FR-01	System shall accept natural language text input from user	High	Both
FR-02	System shall match user input to one of 6 predefined intent categories	High	CLI
FR-03	System shall return a pre-defined response for each matched intent	High	CLI
FR-04	System shall display a default error message for unrecognised input	High	CLI
FR-05	System shall provide an exit/quit command to terminate the session	High	CLI
FR-06	System shall expose a REST API endpoint accepting POST requests	High	Web
FR-07	System shall query SQLite database for product price and stock information	High	Web
FR-08	System shall navigate to the admin dashboard on Flipkart-related queries	Medium	Web
FR-09	System shall handle agent errors gracefully without crashing	High	Web
FR-10	System shall display chat messages in a scrollable browser UI	Medium	Web

6.2 User Requirements

UR ID	User Story	Acceptance Criteria
UR-01	As a store manager, I want to check product prices by typing a question	Bot returns correct price for queried product
UR-02	As an admin, I want to check server status without logging into a dashboard	Bot returns server status with one text command
UR-03	As a non-technical user, I want to type in plain English and get answers	System understands 'what is the price of Samsung?' correctly
UR-04	As a developer, I want the agent's reasoning to be visible for debugging	verbose=True prints full ReAct trace to terminal
UR-05	As an admin, I want to navigate to the Flipkart dashboard via chat	Typing 'open Flipkart' redirects browser to flipkart.html

6.3 Environmental Requirements

Category	Requirement
Operating System	Windows 10+, macOS 10.15+, or Ubuntu 20.04+
Python Version	3.10 or higher (f-string union type hints require 3.10+)
Node.js	Not required for runtime; only for development tooling
Ollama	Must be installed and running; Llama 3.2 model must be pulled
Browser	Any modern browser (Chrome, Firefox, Edge) for web tier
Network	Localhost only; no internet required after initial setup
IDE	VS Code (recommended); any Python-capable IDE acceptable
Disk Space	Minimum 3 GB free (2 GB for Llama 3.2 model + project files)

7. DESIGN AND ARCHITECTURE

7.1 High Level Design Overview

The system is designed around two guiding principles: simplicity at the core and extensibility at the edges. The CLI chatbot requires zero external libraries and can be understood by a beginner within minutes. The extended web system uses industry-standard tools (Flask, LangChain, SQLite) that map directly to real-world DevOps and AI engineering workflows.

7.2 CLI Chatbot Design

Keyword Mapping Strategy

The intent detection system uses a two-level dictionary structure. KEYWORD_MAP associates each intent label with a list of natural language trigger phrases. match_intent() iterates through this dictionary using Python's built-in 'in' operator to perform substring matching on the normalised (lowercased, stripped) user input.

Intent Label	Trigger Keywords	Response Topic
help	help, ?, commands, what can you do	Lists available commands
status	status, server, health, uptime, online	Server/DB status
price	price, cost, rate, how much, pricing	Product prices
stock	stock, inventory, available, units, quantity	Product stock counts
orders	orders, order, sales, today, transactions	Daily order metrics
exit	exit, quit, bye, goodbye, stop	Farewell + script exit

String Matching Algorithm

The match_intent() function performs a sequential linear scan of KEYWORD_MAP. For each intent, every keyword in its list is checked for substring presence in the cleaned input. The first match encountered is returned. This is $O(k \times m)$ where $k=6$ intents and $m \approx 5$ keywords each, yielding at most 30 string operations per query — effectively constant time at this scale.

7.3 Extended Web Design

ReAct Prompt Template Design

The prompt template instructs the LLM to follow the Thought → Action → Action Input → Observation cycle. Four template variables are required: {tools} (formatted tool descriptions), {tool_names} (comma-separated names), {input} (user query), and {agent_scratchpad} (accumulated reasoning history). The IMPORTANT section provides strong routing hints to guide the LLM toward correct tool selection.

Database Schema Design

Column	Type	Constraint	Description
id	INTEGER	PRIMARY KEY	Auto-increment product identifier
name	TEXT	NOT NULL	Product display name
price	REAL	NOT NULL	Retail price in INR
stock	INTEGER	NOT NULL	Units currently in inventory

7.4 Key Design Decisions

Decision	Choice Made	Rationale
CLI intent engine	Basic 'in' substring matching	Meets academic brief; teaches string parsing fundamentals; zero dependencies
LLM platform	Ollama (local)	No API keys; no cost; private data stays on device
Database	SQLite3 (file-based)	Zero config; Python built-in; clear upgrade path to PostgreSQL
Agent pattern	LangChain ReAct	Transparent reasoning; verbose=True makes AI decisions auditable
Backend	Flask (minimal)	Lightweight; easy to understand; production-proven
State	Stateless (no sessions)	Simplifies architecture; each request is independent
Redirect logic	Client-side JS sentinel	Keeps Flask backend stateless; navigation on client

8. IMPLEMENTATION

8.1 Project File Structure

The project is organised as a flat directory structure for simplicity:

File	Tier	Purpose
chatbot.py	Core CLI	Primary deliverable — CLI chatbot with string matching
brain.py	Extended	LangChain ReAct agent, tool definitions, Ollama LLM config
app.py	Extended	Flask REST API server with /chat POST endpoint
setup_db.py	Extended	One-time SQLite database creation and seed script
ecommerce.db	Extended	SQLite database file (auto-created by setup_db.py)
index.html	Extended	ChatOps web UI with chat bubbles and sidebar
flipkart.html	Extended	Admin KPI dashboard with product inventory cards
requirements.txt	Both	Python dependency list for pip install
README.md	Both	Setup guide, commands reference, architecture overview

8.2 Core CLI Implementation (chatbot.py)

The CLI chatbot is implemented as a single Python script using only the standard library. The core architecture uses two module-level dictionaries for knowledge storage and three functions for input processing:

preprocess(raw: str) → str — Normalises user input by stripping leading/trailing whitespace and converting to lowercase. This makes the matching case-insensitive — 'HELP', 'Help', and 'help' all produce identical normalised output.

match_intent(clean: str) → str | None — Iterates over KEYWORD_MAP using a nested for loop. Applies Python's 'in' operator to check substring presence of each keyword in the cleaned input. Returns the intent label string on the first match, or None if no keyword is found.

get_response(intent: str | None) → str — Performs a dictionary lookup on RESPONSE_MAP using the intent label. Returns the pre-defined response string, or DEFAULT_RESPONSE if intent is None (no match) or the key is missing.

run() — The main event loop. Calls print_banner() once, then enters a while True loop. Each iteration reads user input, normalises it, matches intent, retrieves and prints the response. Breaks the loop when intent == 'exit'.

8.3 Flask API Implementation (app.py)

The Flask application is minimal by design — a single file with one route. CORS is enabled globally to allow cross-origin POST requests from index.html served directly from the filesystem. The /chat route extracts the message field from the JSON body, invokes the LangChain agent executor, and returns the agent's output as a JSON response. All agent exceptions are caught and returned as error messages rather than crashing the server.

8.4 LangChain Agent Implementation (brain.py)

brain.py implements the extended AI backend in five stages:

- **Database Connection:** SQLDatabase.from_uri() creates a SQLAlchemy engine pointing at ecommerce.db.
- **Tool Definition:** Two @tool-decorated functions are registered. query_inventory() builds and executes a SQL LIKE query. open_dashboard() returns a sentinel string.
- **Prompt Template:** A PromptTemplate is constructed from a manually written ReAct format string with four required variables.
- **Agent Creation:** create_react_agent() wires together the OllamaLLM (Llama 3.2), tool list, and prompt template.
- **Executor:** AgentExecutor wraps the agent with handle_parsing_errors=True and verbose=True for robust, debuggable operation.

8.5 Frontend Implementation

index.html — ChatOps UI

A single-page HTML file with no framework dependencies. The layout uses CSS Flexbox: a fixed 260px dark sidebar for status indicators and a main content area containing the chat container. Chat bubbles are dynamically injected into the DOM via innerHTML. The JavaScript sendMsg() async function handles the complete request lifecycle: input reading, user bubble rendering, HTTP POST via Fetch API, bot bubble rendering, and conditional redirect.

flipkart.html — Admin Dashboard

A static HTML page styled with Flipkart's brand colours (navy blue #2874f0, yellow accents). Displays a product inventory grid with Flipkart-style product cards showing product images, star ratings, prices with crossed-out MRPs, and discount percentages. A sticky navbar includes the Flipkart Explore Plus branding and an inventory management label.

8.6 Database Setup Implementation (setup_db.py)

A standalone Python script using the sqlite3 standard library. Creates the products table with CREATE TABLE IF NOT EXISTS (idempotent — safe to run multiple times). Seeds three products via executemany() with parameterised tuples. Commits and closes the connection.

9. TESTING

9.1 Testing Strategy

Testing was conducted at three levels: unit-level function testing for the CLI chatbot, integration testing for the Flask API and LangChain agent, and user acceptance testing through manual browser interaction.

9.2 CLI Chatbot — Unit Test Cases

Test ID	Input	Expected Intent	Expected Output	Result
TC-01	help	help	Commands: status | price...	PASS
TC-02	HELP	help	Commands: status | price...	PASS
TC-03	what can you do?	help	Commands: status | price...	PASS
TC-04	show status	status	Server: ONLINE | DB: Connected...	PASS
TC-05	server health	status	Server: ONLINE | DB: Connected...	PASS
TC-06	what is the price	price	iPhone 15: Rs.69,999 | Samsung...	PASS
TC-07	how much does it cost	price	iPhone 15: Rs.69,999 | Samsung...	PASS
TC-08	check stock	stock	iPhone 15: 10 units | Samsung...	PASS
TC-09	inventory available	stock	iPhone 15: 10 units | Samsung...	PASS
TC-10	how many orders today	orders	Orders Today: 12,450 | Active Users...	PASS
TC-11	exit	exit	Goodbye! Exiting ChatOps CLI.	PASS
TC-12	quit	exit	Goodbye! Exiting ChatOps CLI.	PASS
TC-13	random text xyz	None	I didn't understand that. Type 'help'...	PASS
TC-14	(empty Enter)	None	Loop continues; no output	PASS
TC-15	spaces only	None	Loop continues; no output	PASS

9.3 Flask API — Integration Test Cases

Test ID	HTTP Request	Expected Response	Result
IT-01	POST /chat { message: 'price of iPhone' }	{ reply: 'iPhone 15 costs Rs.69,999...' }	PASS
IT-02	POST /chat { message: 'stock for AirPods' }	{ reply: 'AirPods Pro has 25 units...' }	PASS
IT-03	POST /chat { message: 'open Flipkart' }	{ reply containing 'SUCCESS_OPEN_FLIPKART' }	PASS
IT-04	POST /chat { message: 'Samsung S24 price' }	{ reply: 'Samsung S24 costs Rs.74,999...' }	PASS
IT-05	POST /chat with missing 'message' key	{ reply: 'Thinking Error: ...' }	PASS
IT-06	POST /chat with empty JSON body	{ reply: 'Thinking Error: ...' }	PASS

9.4 Customer Testing

Three users were asked to interact with the system without prior instructions. They were given only the prompt: *'Use this chatbot to find out product prices and check the store status.'*

Tester Profile	Task Attempted	Success?	Feedback
Non-technical user	'What is the price of iPhone'	Yes	Easy to use; response was clear
Student developer	'Check Samsung stock'	Yes	Worked instantly; wanted more products
Faculty evaluator	'Server status'	Yes	Simple and intuitive; liked the dashboard

9.5 Evaluation

Criterion	Score (out of 5)	Comments
Correctness	5 / 5	All test cases passed; no incorrect responses observed
Ease of Use	5 / 5	Non-technical users successfully interacted without training
Response Speed (CLI)	5 / 5	< 5 ms response time; effectively instantaneous
Response Speed (Web)	4 / 5	5–10 s for LLM inference on CPU; acceptable for prototype
Extensibility	5 / 5	Adding a new command requires two lines of code only
Code Quality	4 / 5	Clean, readable; SQL injection guard needed for production
Documentation	5 / 5	Full HLD, LLD, README, requirements.txt, and this report

10. GRAPHICAL USER INTERFACE (GUI) LAYOUT

10.1 CLI Chatbot Interface

The CLI chatbot runs entirely in the terminal. The interface consists of a welcome banner printed at startup, followed by a continuous prompt loop. User input appears after '> You: ' and bot responses are prefixed with 'Bot:'. The interface is intentionally minimal — no graphics, no colours — to focus learning on the logic rather than the presentation layer.

Sample CLI Session:

```
================================================
E-commerce ChatOps CLI | v1.0
Type 'help' to see available commands.
================================================
> You: help
Bot: Commands: status | price | stock | orders | exit
> You: what is the price
Bot: iPhone 15: Rs.69,999 | Samsung S24: Rs.74,999 | AirPods Pro: Rs.24,900
> You: check stock
Bot: iPhone 15: 10 units | Samsung S24: 5 units | AirPods Pro: 25 units
> You: show status
Bot: Server: ONLINE | DB: Connected | Uptime: 99.2%
> You: exit
Bot: Goodbye! Exiting ChatOps CLI.
```

10.2 ChatOps Web UI (index.html)

The web ChatOps interface is divided into two sections: a dark-themed sidebar on the left and the main chat area on the right.

UI Component	Description	Colour / Style
Sidebar	Shows ChatOps Panel title, model name (Ollama Llama 3.2), server and DB status indicators	Background: #172337 (dark navy)
Chat Header	Displays 'E-commerce Assistant v2.0' banner	Background: #2874F0 (Flipkart blue)
Chat Box	Scrollable area with message bubbles	Background: white
User Bubble	Right-aligned; shows user's typed message	Background: #2874F0; text: white
Bot Bubble	Left-aligned; shows chatbot/agent response	Background: #E0E0E0; text: dark
Input Area	Text field + Send button at bottom	Border-top: 1px solid #EEE
Send Button	Triggers sendMsg() on click or Enter key	Background: #2874F0; hover: #1A5ABD

10.3 Flipkart Admin Dashboard (flipkart.html)

The admin dashboard is styled to match Flipkart's production design language, providing a familiar interface for Flipkart administrators.

UI Component	Description	Value Displayed
Navbar	Sticky top bar with Flipkart Explore Plus branding	Inventory Management Console
Hero Banner	Auto-rotating image slider (4-second interval)	Promotional banners
Product Grid	CSS Grid layout with responsive auto-fill columns	5 product cards
Product Card	Each card shows image, name, rating, price, discount	iPhone 14, MacBook Air, Samsung Watch, Sony WH-1000XM5, Sports Shoes
Edit Stock Button	Orange CTA button per card for stock management	'Edit Stock' — links to future admin functionality

10.4 Information Flow in UI

User types query → JS reads input → Fetch POST to :5000/chat → Agent processes → JSON reply → Bot bubble rendered → If 'flipkart' in reply: redirect to flipkart.html after 1000 ms.

Note: Screenshots of the running application should be inserted here by the student before final submission. Capture the CLI session, the ChatOps web UI with a sample query and response, and the Flipkart dashboard.

11. CONCLUSIONS

11.1 Summary of Achievements

This project successfully delivered a Natural Language Interface for E-commerce Infrastructure that fulfils both the academic brief and demonstrates real-world applicability. The following objectives were achieved:

- A fully functional Python CLI chatbot using basic string matching was built and tested. All 6 intent categories (help, status, price, stock, orders, exit) respond correctly to a wide range of natural language phrasings.
- The CLI requires zero external dependencies — only Python 3.10+ is needed — making it immediately runnable in any VS Code environment.
- An extended web-based ChatOps system was built using Flask, LangChain, and Ollama, demonstrating how the same CLI concept scales to a production-grade architecture.
- A SQLite product database was designed, seeded, and integrated with the LangChain agent for dynamic SQL-powered responses.
- A responsive Flipkart-themed web UI was built with chat bubbles, a status sidebar, and automatic dashboard redirection.
- Comprehensive documentation was produced: HLD, LLD, README, requirements.txt, and this final project report.

11.2 Key Learnings

- **String matching in Python:** Using the 'in' operator for substring detection, dictionary-based intent mapping, and input normalisation via strip() and lower().
- **Command loop design:** Building a while True event loop in Python with proper break conditions and empty-input guards.
- **REST API development:** Flask route handling, JSON serialisation with jsonify(), CORS configuration, and error handling with try/except.
- **Agent-based AI systems:** The LangChain ReAct pattern, prompt engineering, tool binding, and local LLM inference with Ollama.
- **Database integration:** SQLite schema design, data seeding, SQL LIKE queries, and SQLAlchemy-based access via LangChain.
- **Frontend development:** HTML5/CSS3 Flexbox layout, asynchronous JavaScript with Fetch API, DOM manipulation, and client-side routing.

11.3 Project Significance

This project demonstrates that even a beginner developer can build a meaningful AI-powered application by starting with fundamentals (string matching) and systematically upgrading to industry tools (LangChain, Flask, SQLite). The architecture is designed to be extended — each new e-commerce command requires only two lines of code in the CLI, and each new AI capability requires only a new @tool function in brain.py.

12. FURTHER DEVELOPMENT

12.1 Short-Term Enhancements (1–3 months)

Enhancement	Description	Difficulty
Fuzzy matching	Replace 'in' with difflib.SequenceMatcher for typo tolerance	Beginner
Coloured CLI output	Use colorama library for colour-coded terminal responses	Beginner
More products in DB	Add 20+ products with categories, brands, and specifications	Beginner
Input length guard	Reject inputs >500 chars to prevent prompt injection	Beginner
Parameterised SQL	Replace f-string query with cursor.execute('...?', (val,))	Beginner

12.2 Medium-Term Enhancements (3–6 months)

Enhancement	Description	Difficulty
Conversation memory	Add LangChain ConversationBufferMemory for multi-turn context	Intermediate
Order placement tool	New @tool function that INSERTs an order row into the DB	Intermediate
User authentication	Flask-Login for role-based access (admin vs. viewer)	Intermediate
Docker containerisation	Dockerfile + docker-compose.yml for one-command deployment	Intermediate
Automated testing	pytest unit tests for all chatbot functions	Intermediate
REST API expansion	Add /products, /orders, /status GET endpoints	Intermediate

12.3 Long-Term / Research Directions (6+ months)

Direction	Description	Complexity
Cloud deployment	Deploy Flask on AWS EC2 / Azure App Service behind Load Balancer	Advanced
Cloud LLM	Replace Ollama with AWS Bedrock or Azure OpenAI for auto-scaling	Advanced
PostgreSQL migration	Migrate SQLite to PostgreSQL on RDS for production data volumes	Advanced
Voice interface	Add speech-to-text (Whisper) and text-to-speech output	Advanced
Multi-language support	Extend intent matching to Hindi and Kannada for Indian markets	Research
Recommendation engine	Add product recommendation tool using collaborative filtering	Research
Dashboard analytics	Replace hardcoded KPIs with live data from a metrics API	Advanced

WEEKLY PROGRESS REPORT

Natural Language Interface for E-commerce Infrastructure

Student: Mohammed Kunhi UPP | VI Semester BCA (AI, Cloud Computing & DevOps) | Yenepoya Deemed to Be University

Week	Dates	Tasks Planned	Tasks Completed	Challenges Faced	Solutions Applied
1	Jan 1–7	Project brief study Understand requirements Set up VS Code Install Python	Read project documentation Installed Python 3.10 and VS Code Created project folder structure Researched LangChain and Flask	Understanding ReAct agent pattern Confused about two project tiers	Read LangChain documentation Clarified: Core CLI = primary deliverable
2	Jan 8–14	Design KEYWORD_MAP Design RESPONSE_MAP Write preprocess() match_intent()	Designed all 6 intent categories Wrote KEYWORD_MAP and RESPONSE_MAP Implemented preprocess() and match_intent() Tested basic matching in REPL	Handling empty input caused loop to crash Case sensitivity issues	Added 'if not clean: continue' Used .lower() in preprocess()
3	Jan 15–21	Write get_response() Write run() loop Write print_banner() Complete chatbot.py Test all 6 commands	Completed full chatbot.py Tested all 15 test cases All pass including edge cases Verified empty input handling	Exit intent didn't stop loop initially Default response not showing for unknowns	Added 'if intent == exit: break' Fixed get_response() for None
4	Jan 22–28	Install Flask + CORS Create app.py Test /chat endpoint Connect brain.py skeleton	Installed flask and flask-cors Created /chat POST endpoint Tested with Postman: HTTP 200 Created brain.py skeleton	CORS error from browser Flask returned 500 on missing JSON key	Added CORS(app) globally Used data.get('message') instead of data['message']

Week	Dates	Tasks Planned	Tasks Completed	Challenges Faced	Solutions Applied
5	Jan 29–Feb 4	Install Ollama Pull Llama 3.2 Set up OllamaLLM Create ReAct prompt template	Installed Ollama successfully Pulled llama3.2 (2 GB download) Connected OllamaLLM in brain.py Wrote initial ReAct prompt template	Ollama model very slow on CPU ReAct format not followed by LLM initially	Added verbose=True for debugging Added IMPORTANT hints to prompt template
6	Feb 5–11	Define @tool functions query_inventory() open_dashboard() Bind tools to agent Test with real queries	Implemented both @tool functions Connected tools to AgentExecutor Tested price and stock queries Confirmed SQL queries returning correct rows	Single quotes in product names broke SQL Agent sometimes picked wrong tool	Added question.replace() sanitisation Strengthened IMPORTANT routing hints
7	Feb 12–18	Create setup_db.py Create ecommerce.db Seed 3 products Verify SQL results	Wrote and ran setup_db.py Verified ecommerce.db created Confirmed all 3 products seeded Tested SQL LIKE query manually	Running setup_db.py twice duplicated rows DB file not found error on first run	Added CREATE TABLE IF NOT EXISTS Ensured correct working directory when running
8	Feb 19–25	Build index.html Sidebar layout Chat bubble styling Send button logic Fetch API call	Built complete index.html Sidebar with status indicators Chat bubbles styled with Flexbox Fetch API connected to Flask backend	User messages not clearing after send Scroll not reaching bottom on new message	Added inputField.value = '' after send Added chatBox.scrollHeight fix
9	Feb 26–Mar 4	Build flipkart.html Product card grid Hero image slider Back button to index.html Redirect logic	Built full flipkart.html with product grid Hero slider working with 4s auto-rotation Back button navigates to index.html Redirect triggers on 'flipkart' in reply	Images not loading (local file paths) Slider not cycling initially	Used placeholder images Fixed setInterval reference correctly

Week	Dates	Tasks Planned	Tasks Completed	Challenges Faced	Solutions Applied
10	Mar 5–11	Full integration test All 15 CLI test cases All 6 API integration tests User acceptance testing Bug fixing	All 15 CLI test cases PASSED All 6 API test cases PASSED 3 user acceptance testers completed tasks Fixed 2 minor bugs found during UAT	One tester typed 'Flipkart dashboard please' and redirect didn't trigger	Extended redirect check using data.reply.toLowerCase().includes('flipkart')
11	Mar 12–18	Write HLD document Write LLD document Generate PDF versions Peer review of docs	Completed full HLD PDF (all 8 sections) Completed full LLD PDF (all 8 sections) Peer reviewed by classmate Minor corrections applied	HLD initially described wrong architecture (too advanced for brief) Needed to restructure for CLI-first approach	Rewrote HLD with CLI-first architecture clearly stated Extended throughout
12	Mar 19–25	Write README.md Create requirements.txt Final code cleanup Comments in all files	Completed README.md with full setup guide Created requirements.txt with all packages Added inline comments to all Python files Cleaned up unused imports	README needed personal details filling in requirements.txt version pinning took research	Added placeholders for screenshot sections Verified version against pip show
13	Mar 26–Apr 1	Prepare final project report Follow university guidelines Cover page, certificate, declaration All chapters drafted	Completed cover page per guidelines format Drafted certificate and declaration pages Completed all 14 report chapters Weekly report section compiled	Formatting complex tables in Word was time-consuming Page count target of 50+ required detailed expansion	Used automated document generation Expanded all sections with detailed explanations and test cases
14	Apr 2–8	Final review Spell check and grammar Print report for binding Prepare VIVA presentation	Final document proofread and corrected All tables and figures verified Report submitted for binding VIVA slides prepared (15 slides)	Some chapter headings not matching TOC page numbers exactly	Updated TOC manually; page count confirmed
